

New API Release - 29th March 2018

- Isrc - (Lapse Status Reason Code) - added to the Exchange Stream API Order Change Message.

Lapse Status Reason Code Possible Values

This field will now be present in some cases on the Order object of the Order Stream to denote the reason that some or all of the order is lapsed. It will be null if no portion of the order is lapsed or if the order lapsed for some reason other than those listed below.

The full list of currently supported values for this field is:

Code	Description
MKT_UNKNO WN	The market was unknown, presumably removed from the matcher (closed) between bet placement and matching.
MKT_INVALID	The market was known about, but in an invalid state.
RNR_UNKNO WN	The runner was unknown, presumably removed between bet placement and matching.
TIME_ELAPS ED	The bet was waiting in the queue too long, so was lapsed for safety.
CURRENCY_ UNKNOWN	The bet's currency ID was not recognised by the matcher.
PRICE_INVAL ID	The bet's price was invalid, e.g. outside the defined ladder for the market.
MKT_SUSPE NDED	The market was suspended at the time the bet came to be matched.
MKT_VERSION	The bet had a maximum market version set, and the market's version on matching was greater than this.
LINE_TARGET	The bet was on a line market, but was requested targeting profit or payout.
LINE_SP	The bet was on a line market, but was either a BSP bet directly, or requested to PERSIST_TO_SP.
SP_IN_PLAY	The bet was a BSP bet that had somehow come to be placed after turn-in-play.
SMALL_STAKE	The bet's stake was worth less than half a penny in GBP.
PRICE_IMP_T OO_LARGE	When the bet came to be matched, the price available was better than its best permitted price, suggesting a significant shift in the market, presumably due to a major incident, which may have rendered the bet unwanted.
